AMENDMENT TO SPECIFICATION

Please amend the paragraph beginning on Line 5, Page 12 of the specification as follows:

Further provided is a retractable cylindrical finger 42. The retractable cylindrical finger has an external end 44 and an internal end 46. A diametric bore 48 is provided through the external end. A coil spring 50 is provided adjacent to the internal end. A supporting chamber 51 is provided for receiving the coil spring and the internal end of the finger. The finger is retractably coupled to the male extending tube of the hitch draw bar. The finger extends perpendicularly from the end face of the male extending tube. The finger is adapted to retract into the male extending tube. The finger is held extended with the spring. The finger is adapted to retract when the male extending tube of the hitch draw bar is in the female extending tow during the use orientation. The finger is adapted to remain extended when the finger is passed through the pair of apertures during the storage orientation.
